

Markus Gühr, FLASH **Ultrafast x-ray summer school 2023**

https://www-ssrl.slac.stanford.edu/newsletters/headlines/ultrafast_summerschool07_lg.jpg

The headline color is important

Electrons 'bind' nuclei to molecules.

Blue: Part of this lecture

More formal BOA

Black: More material for studying later

For example - what is $\langle \psi_j(r|R) | \nabla_a | \psi_i(r|R) \rangle$?

$$H_e | \psi_i \rangle = E_i | \psi_i \rangle$$

Red: Quiz for this lecture

Quiz: Which particles are faster?

Quiz: Your educational background

What is the discipline of your highest degree?

- a) Chemistry
- b) Physics
- c) Biology/Lifesciences
- d) Engineering
- e) Computer Science
- f) Mathematics
- g) other

<https://pingo.coactum.de/events/966075>

Chemical dynamics in the gas phase

Photosynthesis

Vision

**Vitamin D,
Mutation**

Transformation of light energy to other energies occur (ultra)fast.

Chemical bond change

Quiz: Why are these processes happening on an ultrafast timescale?

Chemical bond change

- a) Because nuclei and electrons just move that fast
- b) Because that might be a way to avoid competing processes
- c) Because otherwise energy would not be stored by released again in form of light

Quiz: Why are these processes happening on an ultrafast timescale?

Chemical bond change

- a) Because nuclei and electrons just move that fast
- b) Because that might be a way to avoid competing processes
- c) Because otherwise energy would not be stored by released again in form of light

Gas phase structural dynamics of molecules

Gas phase structural dynamics of molecules

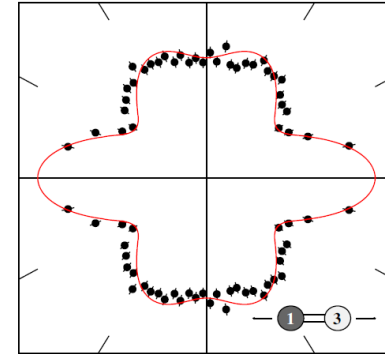

Why doing gas phase molecular studies?

Quantum manipulation possible

Charged particles available

Kastirke et al., PRX **10**, 021052 (2020)

1:1 comparison with high level calculations

Quite a lot of gas phase applications

By No machine-readable author provided. Mkotl assumed (based on copyright claims, GPL, <https://commons.wikimedia.org/w/index.php?curid=423310>)

Outline

Basics: Coupled electronic and nuclear dynamics in molecules

X-ray matter interaction

Two examples for ultrafast x-ray spectroscopy
resonant absorption
photoelectron spectroscopy

Electrons 'bind' nuclei to molecules.

Quiz: Which particles are faster?

Energy

Electrons and nuclei are subject to the same Coulomb forces. Which particles move faster under those forces?

- a) Electrons
- b) Nuclei

Ground State

Quiz: Which particles are faster?

Energy

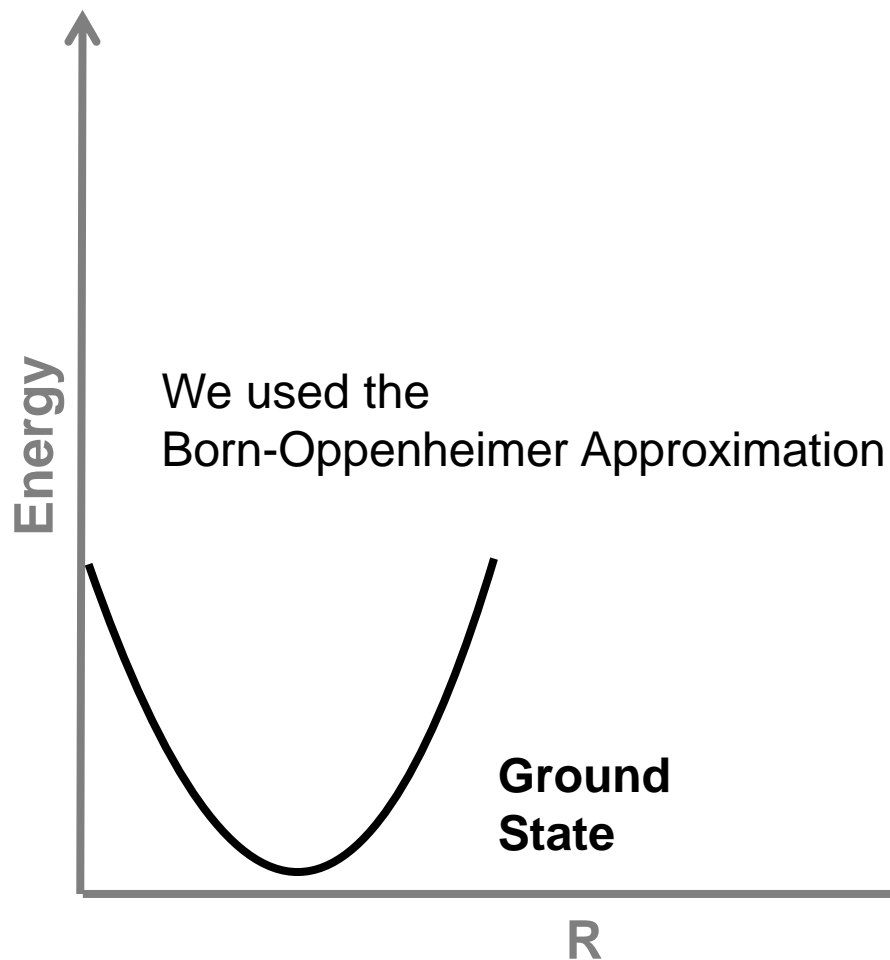

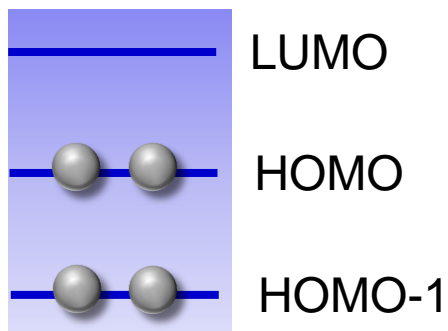

Electrons and nuclei are subject to the same Coulomb forces. Which particles move faster under those forces?

- a) Electrons
- b) Nuclei

Ground State

BOA allows for potentials for nuclei.

More formal BOA

$$H = H_e + T$$

Molecular Hamiltonian

$$T = \sum_{a=1}^M -\frac{\hbar^2}{2m_a} \nabla_a^2$$

Nuclear kinetic energy

$$H_e = \sum_{j=1}^N -\frac{\hbar^2}{2m_e} \nabla_j^2$$

Electronic Hamiltonian

$$-\sum_{j=1}^N \sum_{a=1}^M \frac{Z_a e^2}{r_{ja}}$$

Nuclear Electron attraction

$$+\sum_{j<k} \frac{e^2}{r_{jk}}$$

Electronic repulsion

$$+\sum_{a<b} Z_a Z_b \frac{e^2}{R_{ab}}$$

Nuclear repulsion

$$H = H_e + T$$

$$H |\psi(r, R)\rangle = E |\psi(r, R)\rangle$$

$$H_e |\psi_i(r | R)\rangle = E_i |\psi_i(r | R)\rangle$$

only parametric dependence on R

$$\psi(r, R) = \sum_i |\psi_i(r | R)\rangle \xi_i(R)$$

David Reis' talk yesterday

More formal BOA

See f.i. Jensen
Introduction to Computational Chemistry
pp. 80

$$(H_e + T - E) \sum_i |\psi_i(r | R) \xi_i(R) \rangle = 0$$

multiply by $\langle \psi_j(r | R) |$

$$\langle \psi_j(r | R) | (H_e + T - E) \sum_i |\psi_i(r | R) \xi_i(R) \rangle = 0$$

Neglected in BOA

$$\Rightarrow (E_j(R) + T - E(R)) \xi_j(R) = \sum_{i \neq j} \langle \psi_j(r | R) | T | \psi_i(r | R) \rangle \xi_i(R)$$

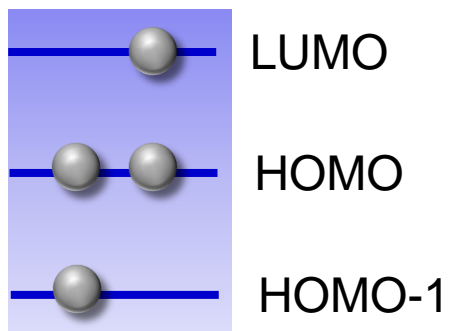

$$+ \sum_{i \neq j} \sum_a \frac{\hbar^2}{m_a} \langle \psi_j(r | R) | \nabla_a | \psi_i(r | R) \rangle \nabla_a \xi_i(R)$$

Light excitation couples to electrons.

Electrons couple to nuclei.

Light excitation couples to electrons.

Electrons couple to nuclei.

Electrons couple to nuclei.

Interuclear separation changes
Angles in space change

Geometries:
Hudock *et al.*,
J. Phys. Chem. A, **111**, 85 (2007)

Nuclei couple to electrons.

Wait a moment....

Remember Jon's lecture.
Electronic motion can be thought of as a superposition of at least two quantum states.

There is a small energy gap ΔE between the two quantum electronic states.

What does that mean for timescale (or period) of electron motion ?

- a) It is long
- b) It is short
- c) I don't care, I need a coffee

Wait a moment....

Remember Jon's lecture.
Electronic motion can be thought of as a superposition of at least two quantum states.

There is a small energy gap ΔE between the two quantum electronic states.

What does that mean for timescale (or period) of electron motion ?

- a) It is long
- b) It is short
- c) I don't care, I need a coffee

So, electrons move slower as the ΔE gets smaller!

The Born-Oppenheimer Approximation breaks down

More formal BOA

See f.i. Jensen
Introduction to Computational Chemistry
pp. 80

$$(H_e + T - E) \sum_i |\psi_i(r | R) \xi_i(R) \rangle = 0$$

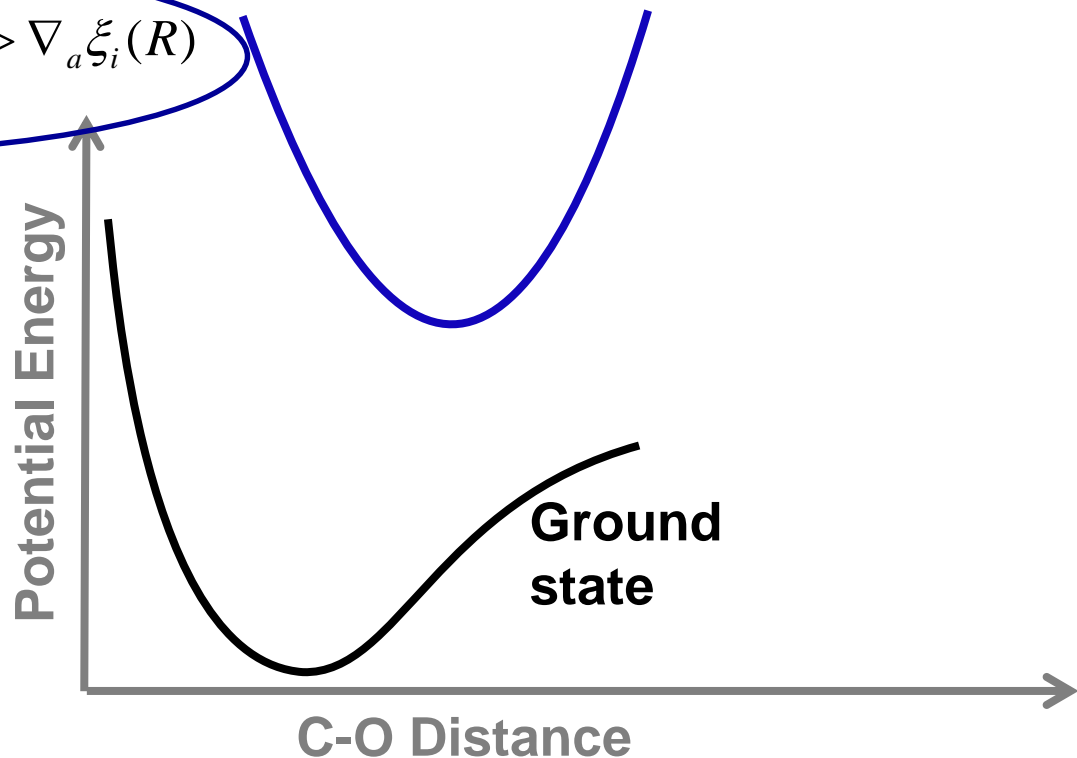

multiply by $\langle \psi_j(r | R) |$

$$\langle \psi_j(r | R) | (H_e + T - E) \sum_i |\psi_i(r | R) \xi_i(R) \rangle = 0$$

Neglected in BOA

$$\Rightarrow (E_j(R) + T - E(R)) \xi_j(R) = \sum_{i \neq j} \langle \psi_j(r | R) | T | \psi_i(r | R) \rangle \xi_i(R)$$

$$+ \sum_{i \neq j} \sum_a \frac{\hbar^2}{m_a} \langle \psi_j(r | R) | \nabla_a | \psi_i(r | R) \rangle \nabla_a \xi_i(R)$$

More formal BOA

For example - what is $\langle \psi_j(r | R) | \nabla_a | \psi_i(r | R) \rangle$?

$$H_e |\psi_i \rangle = E_i |\psi_i \rangle$$

$$\Rightarrow \nabla_a (H_e |\psi_i \rangle) = \nabla_a (E_i |\psi_i \rangle)$$

$$\Rightarrow (\nabla_a H_e) |\psi_i \rangle + H_e (\nabla_a |\psi_i \rangle) = (\nabla_a E_i) |\psi_i \rangle + E_i (\nabla_a |\psi_i \rangle)$$

$$\Rightarrow \langle \psi_j | (\nabla_a H_e) |\psi_i \rangle + \langle \psi_j | H_e (\nabla_a |\psi_i \rangle) = (\nabla_a E_i) \langle \psi_j | \psi_i \rangle + E_i \langle \psi_j | \nabla_a |\psi_i \rangle$$

$$\Rightarrow \langle \psi_j | (\nabla_a H_e) |\psi_i \rangle + E_j \langle \psi_j | \nabla_a |\psi_i \rangle = E_i \langle \psi_j | \nabla_a |\psi_i \rangle$$

$$\Rightarrow \langle \psi_j | \nabla_a |\psi_i \rangle = \frac{\langle \psi_j | (\nabla_a H_e) |\psi_i \rangle}{E_i - E_j}$$

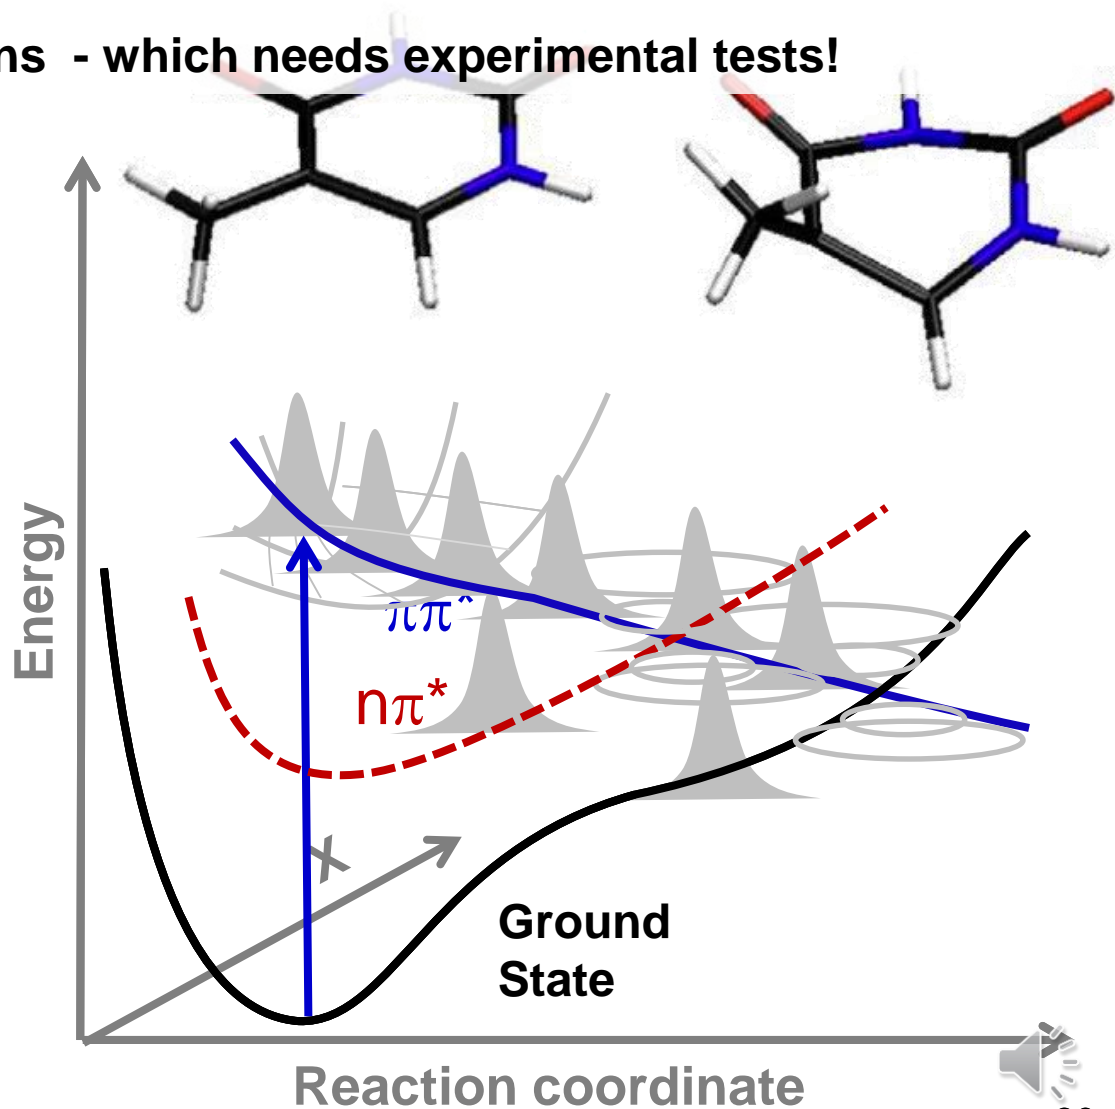

The smaller splitting of adiabatic PES, the bigger non-BOA coupling!!!

A real challenge for theory.

15 nuclei and 30 valence electrons are able to move in 3d, and are coupled!

This needs serious approximations - which needs experimental tests!

Two sides of the problem:

Electronic structure

Nuclear geometry

Asturiol et al.,
J. Phys. Chem. A, **113**, 10211 (2009)
Hudock et al.,
J. Phys. Chem. A, **111**, 85 (2007)

A real challenge for experiments too!

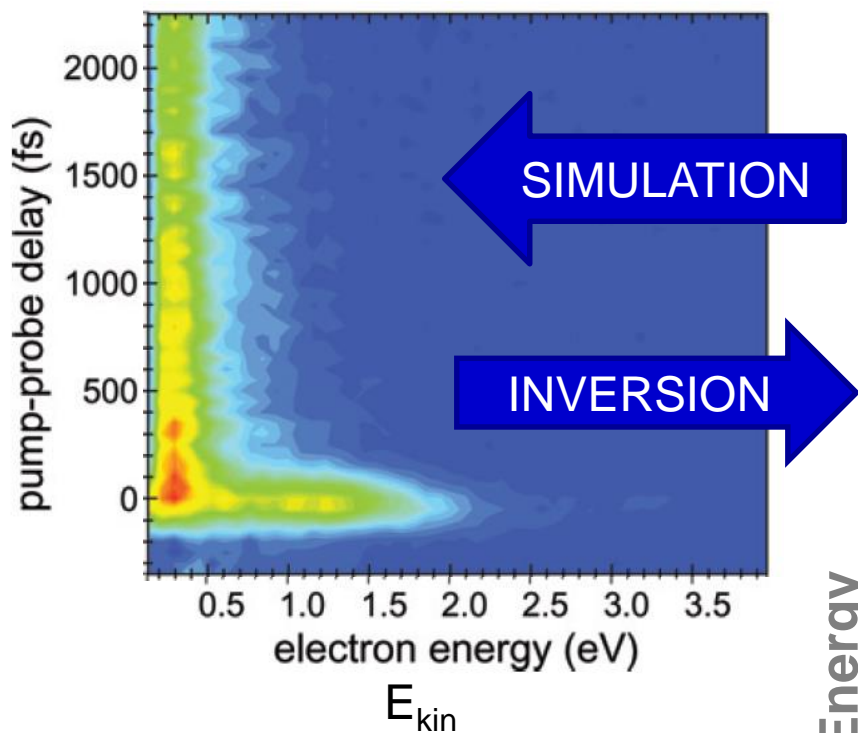

15 nuclei and 30 valence electrons are able to move in 3d, and are coupled!

each particle has 6 scalars (x,y,z,px,py,pz) – 270 scalars to measure!

Problem: how molecular information maps on experimental observables

Observable inversion is impossible!

Ullrich et al. PCCP **6**, 2796 (2004)

Asturiol et al.,
J. Phys. Chem. A, **113**, 10211 (2009)

Hudock et al.,
J. Phys. Chem. A, **111**, 85 (2007)

Few picosecond lifetime of $\pi\pi^*$

The more *different* observables, the easier it is to find something out about a molecule.

From the book cover of:
,Gödel, Escher, Bach' by R. Hofstadter
20th anniversary edition, Perseus Books 1999

Ultrafast X-ray spectroscopy

Ultrafast Hard x-ray/electron diffraction

Why x-rays?

a) Local electronic structure and nuclear geometry

Delocalized valence orbital

Localized core orbital

**What energies are needed
to talk to core electrons?**

Outline

Basics: Coupled electronic and nuclear dynamics in molecules

X-ray matter interaction

Two examples for ultrafast x-ray spectroscopy
resonant absorption
photoelectron spectroscopy

Quiz: Binding energy of a 1s carbon – just ballpark

10 b)50 c)100 d)200 e)300 f)400 g)500 h)600 i)1000
Values in eV

Quiz: Binding energy of a 1s carbon – just ballpark

$$E_n = 13.6 \text{ [eV]} Z^2 (1/n^2) \text{ for H, He}^+, \text{Li}^{++}, \text{Be}^{3+}, \text{B}^{4+}, \text{C}^{5+}$$

Binding energies in eV

He+	54.4	He	24.6
Li++	122.4	Li	54.7
Be3+	217.6	Be	111.5
B4+	340	B	188
C5+	489	C	284

1 eV

10 eV

photon energy

100 eV

Please....order the 1s binding energies $E_{\text{bind},1s}$ of Nitrogen, Oxygen and Carbon

- a) $E_{\text{bind},1s}$ Carbon > $E_{\text{bind},1s}$ Nitrogen > $E_{\text{bind},1s}$ Oxygen
- b) $E_{\text{bind},1s}$ Oxygen > $E_{\text{bind},1s}$ Nitrogen > $E_{\text{bind},1s}$ Carbon
- c) $E_{\text{bind},1s}$ Nitrogen > $E_{\text{bind},1s}$ Carbon > $E_{\text{bind},1s}$ Oxygen

**X-ray
spectroscopy

FLASH: towards a high repetition rate seeded soft X-ray FEL

Tackled

Upcoming

Beyond

- Injector Laser
- Energy upgrade
- 3rd BC FLASH2
- TDS (FLASH2)
- Laser heater
- New bunch compressors (linac)
- Variable gap undulators (FLASH2)
- interim pump-probe laser (FLASH1)
- New beamline FL23 (FLASH2)
- Afterburner FLASH2

- High rep. rate seeding (FLASH1)
- Photon diagnostics (FLASH1)
- Flexible pump-probe
- New beamlines

- New undulator schemes (FLASH2)
- New lasing concepts (FLASH2)

nitrogen K-edge

Variable polarization at third harmonic

Externally seeded operation up to the carbon K-edge

FLASH 2020+ Science challenges

Utilizing the unique properties of the new FLASH

Ground state isomerization of azobenzene
Tavadze et al. JACS 2018

UV – induced lesion in DNA

Examples from the FLASH strategy workgroups utilizing the high coherence/spectral brightness and repetition rate:

Ground state chemistry (rare events)
catch the rare events where a reaction happens

Life's photoprotection (dilute samples with traps)
Learning how nature protects itself from UV damage

Plasmonic photocatalysis (dilute samples, brightness)
Harvest sunlight via nanomaterials to accomplish green chemistry

Materials phase transition dynamics/control (brightness)
Understand material transformations in fields for future electronics

Zhang *et al.*, Chem. Rev. **118**, 2927 (2018)
